GENERAL INSTRUCTIONS FOR COMPLETING SF 298

The Report Documentation Page (RDP) is used in announcing and cataloging reports. It is important that this information be consistent with the rest of the report, particularly the cover and title page. Instructions for filling in each block of the form follow. It is important to *stay within the lines* to meet *optical scanning requirements*.

Block 1. Agency Use Only (Leave blank).

Block 2. Report Date. Full publication date including day, month, and year, if available (e.g. 1 Jan 88). Must cite at least the year.

Block 3. Type of Report and Dates Covered. State whether report is interim, final, etc. If applicable, enter inclusive report dates (e.g. 10 Jun 87 - 30 Jun 88).

Block 4. Title and Subtitle. A title is taken from the part of the report that provides the most meaningful and complete information. When a report is prepared in more than one volume, repeat the primary title, add volume number, and include subtitle for the specific volume. On classified documents enter the title classification in parentheses.

Block 5. Funding Numbers. To include contract and grant numbers; may include program element number(s), project number(s), task number(s), and work unit number(s). Use the following labels:

C - Contract	PR - Project
G - Grant	TA - Task
PE - Program Element	WU - Work Unit Accession No.

Block 6. Author(s). Name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. If editor or compiler, this should follow the name(s).

Block 7. Performing Organization Name(s) and Address(es). Self-explanatory.

Block 8. Performing Organization Report Number. Enter the unique alphanumeric report number(s) assigned by the organization performing the report.

Block 9. Sponsoring/Monitoring Agency Name(s) and Address(es). Self-explanatory.

Block 10. Sponsoring/Monitoring Agency Report Number. (If known)

Block 11. Supplementary Notes. Enter information not included elsewhere such as: Prepared in cooperation with...; Trans. of...; To be published in... When a report is revised, include a statement whether the new report supersedes or supplements the older report.

Block 12a. Distribution/Availability Statement. Denotes public availability or limitations. Cite any availability to the public. Enter additional limitations or special markings in all capitals (e.g. NOFORN, REL, ITAR).

DOD - See DoDD 5230.24, "Distribution Statements on Technical Documents."

DOE - See authorities.

NASA - See Handbook NHB 2200.2.

NTIS - Leave blank.

Block 12b. Distribution Code.

DOD - Leave blank.

DOE - Enter DOE distribution categories from the Standard Distribution for Unclassified Scientific and Technical Reports.

NASA - Leave blank.

NTIS - Leave blank.

Block 13. Abstract. Include a brief (Maximum 200 words) factual summary of the most significant information contained in the report.

Block 14. Subject Terms. Keywords or phrases identifying major subjects in the report.

Block 15. Number of Pages. Enter the total number of pages.

Block 16. Price Code. Enter appropriate price code (NTIS only).

Blocks 17. - 19. Security Classifications. Self-explanatory. Enter U.S. Security Classification in accordance with U.S. Security Regulations (i.e., UNCLASSIFIED). If form contains classified information, stamp classification on the top and bottom of the page.

Block 20. Limitation of Abstracts. This block must be completed to assign a limitation to the abstract. Enter either UL (unlimited) or SAR (same as report). An entry in this block is necessary if the abstract is to be limited. If blank, the abstract is assumed to be unlimited.

ABSTRACT

SUPPLY USAGE REQUIREMENTS ESTIMATOR (SURE) VERSION 2.0 by
Major John M. Friedson, USA, 448 pages.

SURE 2.0 is a compiled, stand-alone dBase IV version 2.0 system that allows planners to estimate detailed equipment-based consumption for supply classes III and V, and population-based consumption for classes I, II, IV, VI, and VIII, and water. It is a replacement for the previous SURE 1.x system that required a copy of Lotus 1-2-3 version 2.x. Hardware requirements for SURE 2.0 are a DOS-based system with 2MB memory or greater, and a hard drive with 3MB or more free disk space available for installation. Use of SURE 2.0 may require from two to twenty MB additional disk space depending on user entries.

SURE 2.0 uses doctrinal methods for estimating logistics requirements by providing equipment data and formulas for a number of environmental and combat conditions. SURE's concept of orders-based planning integrates phased operations, parameter sets of operational conditions, and task-organized groupings of units to facilitate the correlation of logistics estimates to operations plans and orders.

CHAPTER I INTRODUCTION

The supply system must be responsive, efficient, and simple to operate. It must be able to adjust to requirements of supported units and be able to forecast and satisfy fluctuating demands.¹ FM 101-10-1/2

Chapter 2 of Field Manual 101-10-1/2, *Staff Officers' Field Manual Organizational, Technical, and Logistical Data Planning Factors (Volume 2)* is the Army's primary handbook for estimating the food, water, clothing, equipment, arms, ammunition, fuel, and materials needed to conduct combat operations. It provides doctrinal methods for estimating those requirements through by providing equipment data and formulas for a number of environmental and combat conditions. The large number of possible Army units, wide variety of equipment, a and multiple permutations of environmental and combat conditions, however, makes manual calculation of these estimates difficult and time-consuming.

In an effort to overcome these limitations, the first commonly fielded program to automate the estimate process is the currently fielded Supply Usage Requirements Estimator, SURE 1.x.² This system uses a series of Lotus 123 version. 2.x templates that "allow planners to estimate detailed equipment-based consumption for supply classes III and V, and population-based consumption for classes I, II, IV, VI, and VIII, and water."³ This system has the advantages of being able to be run on machines meeting a minimal hardware requirements, but its capabilities are limited by the programming constraints common to macro-based systems. As a result, SURE 1.0 has only limited capacity to save user work, is limited to calculations for a single day's consumption, and has no help system. Additionally, it requires the user to own a copy of Lotus Development Corporation's Lotus 1-2-3™, and a version 2.x copy in particular. To overcome these disadvantages, U.S. Army Combined Arms Support Command (CASCOM) Force Development and Evaluation Directorate (FD&E) decided that a new version of SURE, a database-based,

compiled (and thus a stand-alone program) version should be the next step in the SURE developmental process.

CASCOM's requirements for SURE 2.0, the compiled version, was for it to at least duplicate current SURE 1.0 capabilities, to be developed under one of a limited number of database systems, be dBase™ file compatible, and to offer as many as possible of a number of additional enhancements. Possible enhancements included, but were not limited to such features as a user-friendly menu system, on-line help, single-pass calculation of estimates for multiple classes of supply, and task force building. Most, although not all, CASCOM desires for improvements are made in the SURE 2.0 system.

In addition, while a superb example of spreadsheet capabilities, the original SURE's limitations make it of limited use for operational planning. It has no provisions for saving parameters for use in creating a logistics estimate for an operational scenario, no provisions for multiple or fractional days, and no ability to correlate estimates with specific phases of an operation. Indeed, a new calculation must be made for every day of an operation where any planning factor changes. In addition to CASCOM requirements and desires, the purpose of developing the SURE 2.0 system under the auspices of the Command and General Staff College (CGSC), and the School of Advanced Military Studies (SAMS) in particular was to make it a better tool for operational planners.

Combining CASCOM requirements to duplicate the functionality of the original SURE system, plus enhancements, with the objective of also making it a tool for operational planners has resulted in a stand-alone system with greatly enhanced capability at the expense of an increase in complexity for even basic operations. Both of these conditions are the result of structuring SURE 2.0 around the concept of orders-based planning.

In SURE 2.0, orders-based planning integrates the concepts of phased operations, parameter sets of operational conditions, and task-organized groupings of units to facilitate the correlation of logistics estimates to operations plans and

orders. The framework for the system in an the Order⁴, which may be subdivided into as many as nine Phases, each Phase being up to 99.99 days in length. To each order may be assigned any number of Task Organizations, themselves composed of any number of units. For each Phase of the Order, each Task Organization is assigned a Parameter Set, a collection of battlefield and logistical conditions including Area Profile, Combat Intensity, ration cycle, etc.

Although orders-based planning provides enormous flexibility, it does require the user, at a minimum, to create one Unit from an Standard Requirements Code (SRC), one Task Organization from that Unit, one Order with at least one Phase, and one Parameter Set with the appropriate conditions to perform any calculations whatsoever. Considerable effort has been made through the use of on-screen assistance and an additional on-line context sensitive help system to make that process both quick and easy to do. It is, however, different from the original SURE 1.x system, which allows direct manipulation of and calculations based on the SRCs provided. SURE 2.0 preserves the original databases and allows their replacement with updated versions without sacrificing user-developed Units. SURE 2.0 does duplicate 1.x's functionality in terms of the kinds of information calculated and the estimates provided to the user.

One area in which SURE 2.0 was not able to meet design preferences was in minimum system requirements. As a number of older DOS-based machines with only 640K of RAM and small (20 MB) hard drives are still in common use in the Army, it was desired that SURE 2.0 could be run on those platforms. The minimum requirements of dBase IV 2.0 compiled systems, however, is for 640K of base memory and 1MB of extended or expanded memory. When this was identified, CASCOM decided to continue utilizing the dBase compiler, trading the advantages of speed, code maintenance, and ease of use against a more limited set of machines on which the program could be run. In addition to memory requirements, SURE 2.0 also required the 'Files' setting in system Config.sys files to be set to 60 or greater.

The SURE 2.0 system started development in November 1993, with projected fielding in late spring or early summer of 1994. The developmental process passed through three general phases: concept development and generation of Alpha code; development of Beta code and Beta testing at Fort Leavenworth's CGSC, and code proofing at Fort Lee. Beta testing at Fort Leavenworth was done by an Advanced Logistics (A459) class in the Command and General Staff College, under the direction of MAJ Richard Simmis of the Department of Sustainment and Resourcing Operations (DSRO), and by SAMS students during their Battle Command Training Program (BCTP). Upon completion of Beta testing and submission of the code, databases, and this document to the School for Advanced Military Studies the product will be passed on to CASCOM for final proofing and fielding. Future development and code maintenance will be done by CASCOM.

CHAPTER II PROGRAM STRUCTURE

This chapter is a basic roadmap for future CASCOM programmers doing code maintenance or updates. It reviews the data file listings and general program structure, and is ment to be used in conjunction with the Programmers References in Annes E.

SURE 2.0 allows users to copy and use CASCOM provided databases without modifying the original information. Table 1 below lists the CASCOM databases and their functions (additional data can be found in the Database Structure Summary in Annex E):

**TABLE 1
CASCOM AND FM 101-10-1/2 DATABASES⁵**

.dbf	Use	Interaction
Ammorate	Ammunition consumption data for all ammunition-using LINs.	Used in calculating ammunition consumption. Related to Csrclinq through lin.
Class_I	Ration types and planning factors.	Used in selection and calculation of ration consumption.
Dodic	Nomenclature, weight, and cube for all ammunition DODICs.	Used in calculating ammunition consumption. Related to Ammorate through dodic.
Echelons	Echelons for water consumption.	SURE attempts to guess Unit echelon, this allows for user correction.
Help	Stores context-sensitive help.	Accessed by F1 key or browsing or printing from Help menu.
Intensty	Intensity and factors for ammunition consumption rates.	Used in calculating ammunition consumption.
Linlist	Equipment from which users can pick to add to their units.	Additions to Csrclinq.dbf based on selections from this list.

.dbf	Use	Interaction
Medical	Class VIII consumption in pounds per man per day. Echelon and intensity peculiar to this database.	Used in calculating Class VIII consumption.
Polrate	Fuel consumption data for all fuel-using LINs.	Used in calculating fuel consumption. Related through pol_type to each other. Polrate is related to Csrclinq through lin.
Polwgt	Pounds per gallon of each fuel type.	
Posture	Ammunition consumption posture.	Used in calculating ammunition consumption.
Profiles	Area Profiles with equipment use hours and kilometers per day.	Used in calculating fuel consumption. Related to Cprofile through profilenam.
Srclist	SRC's from which users can pick to create Units.	Copies to Csrclist, the user's Unit database.
Srclinq	Equipment LINs for each SRC.	Copies to Csrclinq, the equipment list in the user's Units.
Water	Water consumption per man per day based on climate.	Used in calculating water consumption.

SURE also has an extensive set of databases used for user data, listed below in Table 2:

TABLE 2
USER AND REPORT CREATED DATABASES

.dbf	Use	Interaction
Ammoest	Stores ammunition consumption estimated data.	Created when user selects order for estimation in Orders-based Reports subprogram.
Cl_other	Stores Class I, IV, VIII, and water consumption estimated data.	

.dbf	Use	Interaction
Cprofile	Stores user Parameter Set information, including Area Profile, Intensity, Intensity Factor, Ration Cycle, water and Medical profiles.	Created and edited in Parameter Sets subprogram set. Related to Ordertas through profilenam.
Csrclist	Stores user Units.	Created and edited when user creates Units from SRCs in Units subprogram set.
Csrclinq	Stores user's Unit's equipment LINs and quantities.	Created and edited when user creates Units from SRCs in Units subprogram set.
Orderlst	Stores list of Orders to which Task Organizations with Parameter Sets are assigned.	Created and edited when user creates an Order in the Orders subprogram set. Information drawn from the Taskorg, and Cprofile databases is combined with that from the Order creation and editing screens to create and maintain Ordertas.
Ordertas	Stores Task Organization, strength, and Parameter Set assignment data for each order.	
Polest	Stores fuel consumption estimated data.	Created when user selects order for estimation in Orders-based Reports subprogram.
Taskorg	Stores Unit listings for each Task Organization.	Created and edited when user creates a Task Organization from Units in the Task Organization subprogram set.
Temp	Used by SURE to copy records for temporary processing.	Automatic, no user interaction required.
Ttemp		
Tttemp		

SURE 2.0 contains six major program sets, each defined by a PAD statement in the main sure.prg: Units, Task Organizations, Parameter Sets, Orders, Reports, Utilities, and Help. The following sections review the major functions performed and major sub-programs of each of these program sets. (Additional information on programs and procedures can be found in the Data Dictionary and Program Listings in Annex E.)

TABLE 3
SUB-PROGRAMS IN THE UNIT PROGRAM SETS

Program	Functions
createsr.prg	Creates Units from SRC's
editunit.prg	Edits existing Units
custunit.prg	Creates custom Units from LINs
delunit.prg	Deletes Units

Task Organizations

After at least one Unit has been created, the user may create a Task Organization. Task Organizations also require unique names, although their descriptions may be shared. A Task Organization may have any number of Units assigned to it, and no Unit may be deleted that is assigned to a Task Organization. Task Organizations are one level deep, i.e., only Units can be assigned to Task Organizations - Task Organizations cannot be assigned to each other. Although the desirability of multiple levels of subordination is recognized, it was beyond the scope of this version of SURE to do considerations of duplication and recursiveness.

Major sub-programs in the Task Organization program set are in Table 4 below:

TABLE 4
SUB-PROGRAMS IN THE TASK ORGANIZATION PROGRAM SET

Program	Functions
createta.prg	Creates Task Organizations from Units
createtc.prg	Creates Task Organizations by copying previous ones.
edittask.prg	Edits Task Organizations
deltask.prg	Deletes Task Organizations

Parameter Sets⁷

The conditions that each Task Organization must operate under during each Phase of an Order are determined by assigning Parameter Sets. Parameter Sets are created by the user by assigning an area profile, intensity and intensity factor, ammunition consumption posture, ration cycle, medical use parameter and water use parameter. These permit complex sets of conditions to be rapidly assigned during the Order creation and editing process. Parameter set names are unique and are not editable after creation.

Major sub-programs in the Parameter Set program set are:

TABLE 5
SUB-PROGRAMS IN THE PARAMETER SET PROGRAM SET

Program	Functions
createpr.prg	Creates Parameter Sets
editprof.prg	Edits Parameter Sets
delprof.prg	Deletes Parameter Sets
crecuspr.prg	Creates Custom Area Profile

Orders

Users establish Orders to define the number of Phases and lengths of each Phase which SURE uses with Parameter Set and strength settings to calculate consumption estimations for each Unit, each Task Organization, and for the Order as a whole. After a Task Organization is assigned to an Order, a Parameter Set is assigned to each Task Organization for each Phase of the Order, and, optionally, the percent strength for each Task Organization for each Phase may also be adjusted.

Strength changes from 100%, if any, are applied to all supply estimates. For example, all Units of a Task Organization which has been assigned an 80% strength for a particular Phase of an Order will have their consumption estimates

reduced by 20% from normal for the same time period. This reduction applies to POL and ammunition estimates as well as to Class I and water estimates for personnel. Its primary application is to approximate those effects anticipated by the Order's manoeuvre planners.

Major sub-programs in the Orders program set are:

TABLE 6
SUB-PROGRAMS IN THE ORDERS PROGRAM SET

Program	Functions
createor.prg	Creates Orders
editorde.prg	Edits Orders
delorde.prg	Edits Task Organizations

Reports

Estimate calculations based on user Orders, with their associated Task Organizations and Parameter Sets, are made after the user selects an Order in the Orders-based reports subprogram set. After calculations have been made and stored in the Ammoest, Polest, and Cl_other databases the user is offered the choice of printing reports to the screen, to file, or to the printer. Two types of reports are available for fuel and ammunition estimates, LIN by LIN, or summary only. While all reports produce summary estimates for each Unit, for each Task Organization, and for the Order Phase-by-Phase, the LIN-by-LIN option also lists usage for each equipment LIN in each Unit in the POL or ammunition reports. These reports can be quite lengthy, and users are advised to print them to file rather than the screen.

Major sub-programs in the Reports program set are:

TABLE 7
SUB-PROGRAMS IN THE REPORTS PROGRAM SET

Program	Functions
orderepl.prg	Calculates logistics estimates and stores them in polest, ammoest, and cl_other databases. This information is accessed through the printpol.prg, printamm.prg, and printoth.prg programs.
sysrep.prg	Allows users to print provided and user-created databases.

Utilities

Several utilities are available through the Utilities subprogram set. SURE 2.0 is compiled under Borland's dBase IV version 2.0 compiler, and the indexes are maintained in .mdx format. Unlike dBase III's .ndx file system, .mdx's which are corrupted or out of date with their associated .dbf files are recognized automatically, and the user is prompted to reindex. Nonetheless, due to the relative newness of the 2.0 compiler the option of manually forcing a reindex of all indexed files in the system has been made.

As not all users will have or be familiar with a general purpose file backup program, simple backup and restore subprograms copy user-created .dbf and .mdx files to a floppy disk. While the system does allow for multiple diskettes, it does not provide for splitting a single file across diskettes. The common use of high density (1.2 and 1.4 MB diskettes) should allow all but the largest of systems to be backed up and restored from this system.

SURE fuel and ammunition reports are similar to those in SURE 1.0, and also require 17-pitch (compressed) print to line up properly when printed. Unfortunately, not all printers are easily adjusted from their control panels to provide this pitch. Three general printer types are supported by SURE to turn this feature on or off in most printers: Epson/IBM compatible dot matrix, HP Laserjet compatible, and HP Deskjet (PCL) compatible. Once the user has made a setting from the 'Compressed Print ON' submenu it is retained and automatically accessed during

the report printing process. In any event, the ability to print to an ASCII file, then import the file to a work processor should overcome the printer problem for virtually all printers.

Major sub-programs in the Utilities Program Set are:

TABLE 8
SUB-PROGRAMS IN THE UTILITIES PROGRAM SET

Program	Functions
reindx.prg	Reindexes (recreates) all .mdx files.
backdbf.prg	Back-up user-created databases and indexes to floppy.
restoref.prg	Restore user databases and indexes from floppy disk.
compress.prg	Turns on compressed (17-pitch) print and sets SURE to automatically print reports in compressed mode where required.
uncompre.prg	Turns off compressed print.

Help

Users are guided through the SURE system's operation in two ways. First, most screens in the system have on-screen instructions from the subprogram's associated inst*.prg procedure file. If this information is not sufficient, the user can access context-sensitive help by pressing the F1 key. This will access the Help.dbf down to the subprogram set level. The Help.dbf can also be accessed from the Help menu. A larger display of each help subject is used when accessed in this manner, as there is no need for the user to view the current on-screen menu. One or all Help subjects can be printed to the printer. When the Help.dbf is printed this way, the associated menu for a program set is also printed.

Major sub-programs in the Help program set are:

TABLE 9
SUB-PROGRAMS IN THE HELP PROGRAM SET

Program	Functions
helpndx.prg	View Help subjects via Help index.
prnhelp.prg	Print one or all Help topics.

Additional, detailed information on fields, programs, and procedures is located in the Tree, Datadict, and Prcsumry sections located in the appendixes.

CHAPTER III USER HELP

The following section is the SURE 2.0 user help system. It is accessible from SURE 2.0 by pressing the F1 Key, which gets context-sensitive help down to the program-set level on screen, or by accessing the Help menu. The Help menu allows the user to view the Help system by subject, or to print one or all Help subjects. The following sections are, except for formatting, as they would be if printed by a user from the Help menu's 'Print Instructions' sub-program set.

The Help System

Browse Help Print Instructions

A. Context-sensitive Help is available in many parts of the SURE System by pressing F1. You may print out the entire Help System from the Main Help Menu. In context sensitive Help, if additional pages are available, a down-arrow will appear in the lower right corner of the Help frame. If you are in a second or subsequent Help page, an up-arrow will appear. You may transfer between screens using either Up/Down arrows or Page-Up Page-Down Keys. When you are done with Help, press the Enter or Esc Keys to return to the SURE program.

Units Task Organizations Parameter Sets Orders Reports Utilities
Help QUIT

B. A Primer on the SURE system.

HOW THE SURE SYSTEM WORKS

Using SURE you create Units from SRC's and their associated equipment LINs, group your Units into Task Organizations, and then assign Task Organizations to an Order. A Parameter Set is assigned to each Task Organization for each

Phase of the Order. The SURE system calculates estimated consumption data for each Unit in each Task Organization for every Phase of the Order, and also sums total estimated consumption for each Task Organization and for the Order overall.

**** To do any logistical estimations with SURE 2.0 you must have at least one Unit, one Task Organization, one Parameter Set, and one Order! ****

UNITS

Units are normally based on SRC's, which are lists of unit sets of equipment in TOE authorized combinations and quantities. Standard SRC's are supplied with the SURE system. Units are usually created by copying SRC listings, then adding or deleting equipment LINs and changing quantities as necessary. Units may also be created from scratch by assigning all equipment LINs and quantities.

Units created from SRC's are given generic names, i.e., 'Infantry Company' if they are to be used generically in multiples, or may be given a specific name, such as '1-17th Infantry' if they are to be used individually and are to have their logistics estimates tracked specifically throughout the Phases of an Order. Once created, Units may be assigned in any quantity to any number of Task Organizations.

TASK ORGANIZATIONS

Units are grouped into Task Organizations which may be assigned to any number of Orders. The SURE system allows you to closely parallel the task organization of units in OPLANs and OPORDERS, although SURE groups of Units are only 'one deep' - you cannot group SURE Task Organizations into other Task Organizations.

A typical use of a SURE Task Organization would be to assign a Headquarters Company and three battalions to it, and call that Task Organization a Brigade. However, if the companies within the battalions need to be cross-attached to

create Battalion Task Forces they should be used to create separate Task Organizations (Task Forces) rather than assigning battalions as a Brigade.

MISSION PARAMETER SETS

Parameter Sets are collections of criteria used to calculate logistics requirements. They include combat intensity, ration cycle, and so forth. By creating and saving Parameter Sets with appropriate descriptions, the conditions for each Task Organization in each Phase of an Order can be quickly set or changed.

ORDERS

An Order ties together Task Organizations and Mission Parameter Sets. Each Order consists of up to nine Phases, and each Phase may be up to 99.99 days in length. The conditions established by each Parameter Set are used by SURE in conjunction with the number of personnel and quantity and types of equipment in each Unit to calculate logistics consumption estimates. The use of Units in Task Organizations allows you to produce logistic estimates that parallel the Task Organizations and Phases in an OPORDER or OPLAN.

Also, in order to account for attrition, reconstitution and other changes to Task Organization overall strength, each Task Organization's strength can be adjusted for each Phase of the Order. Logistics estimates are increased or decreased overall based on the percent strength assigned. If no percentage adjustment is made, SURE uses 100% of Unit personnel and equipment strength for each Phase of the Order.

REPORTS

Two categories of Reports are available, Orders-based Reports which produce logistics estimates, and Systems Reports which allow you to print out listings of data provided with the SURE system as well as listings of the Units, Task Organizations, Parameter Sets, and Orders you have created.

ORDERS-BASED REPORTS

Orders-based reports calculate and optionally print logistics estimates. Any changes made to Units, Task Organizations, or Parameter Sets used in an order are automatically reflected in the calculations made.

SYSTEM REPORTS

Systems Reports are useful in planning and adjusting all components of the SURE system. For example, a printed list of the SRC's in the SURE system is useful in planning which ones to select to produce Units. Unit listings facilitate the planning of Task Organizations, while Parameter Set and Task Organization listings help in pre-planning orders.

UTILITIES

Six options are included in SURE's Utilities:

REINDEX FILES

Reindex Files is rarely needed, unless your .MDX files get separated from the rest of your SURE system.

BACKUP FILES

It is highly encouraged to back up your SURE databases and .MDX files to a floppy disk. You should normally do a backup whenever you have done more work than you care to repeat!

RESTORE FILES

This option allows you to copy the files you put on a floppy using the Backup procedure back on to your hard drive.

PRINTER SETUP

Allows you to adjust the printer left margin and page length.

COMPRESSED PRINT ON

Many of SURE's reports require 17-pitch compressed print. If your printer is hard to set manually, SURE will try to do it for you in software.

COMPRESSED PRINT OFF

If you have turned on compressed print from within SURE, this option attempts to reset your printer back to the uncompressed mode.

C1. Creating a Unit

Select SRC (Browse) Select SRC (Find SRC with SRC Number) Add New Unit from SRC or Copied Unit Copy Unit from Existing Unit View Existing Units Return to Main Menu
--

This program provides several ways to create units for use in your Task-Organizations. You may create a unit by copying its TOE name and equipment listing from an SRC, or by copying its data from a unit you have previously created.

'Select SRC (Browse)'

'Select SRC (Find SRC with SRC Number)'

To select an SRC you may either review the complete list of available SRC's (Browse), or enter all or part of a specific SRC if you have that information (Find SRC with SRC Number).

After selecting an SRC to provide base equipment data for you unit, you may either retain the original, generic TOE description for the unit, or give it a unique name, i.e., '1-57 Infantry Bn'. Units formed using the generic name are useful in planning where you need to use 'type' units, whereas unique names allow you to track logistics estimations for a particular unit throughout the Phases of an Order. Either way, you may only use a unique unit name once in your databases, although you may have any number of that unit assigned to any number of Task Organizations.

After selecting an SRC, you must choose 'Create Unit from Selected SRC or Unit' to actually copy the TOE equipment LINs and enter the unit in your unit listing.

'Select SRC (Find SRC with SRC Number)' If you have a list of units with SRC's it is faster to enter them and let SURE locate them. If SURE cannot find an SRC it will automatically start at the beginning of the database and let you Browse to find it.

'Copy Unit from previous Unit' If you are creating several identical or similar units, it may be faster to copy from a previous Unit', then rename and later modify your new unit as required. You must rename the unit if you have copied it from a previous one, as unit names must be unique.

After copying from a previous unit, you must choose Create Unit from Selected SRC or Unit' to actually copy the TOE equipment LINs and enter the unit in your equipment listing.

C2. Editing Unit Data

Select Unit - Browse Unit List
Select Unit - By SRC
Change LIN Quantities
Add Equipment LIN
Delete LIN
Change Unit Strength
Change Unit Echelon
Return to Main Menu

Units you have added to your unit list may be modified in a variety of ways. Any changes you make to a unit are automatically reflected in all Task Organizations and in all Orders which use that Unit. You must choose a Unit before attempting to make any modifications.

'Select Unit - Browse Unit List' allows you to go through the Unit list in alphabetical order and select a Unit to Edit.

'Select Unit - By SRC' allows you to optionally enter an SRC for SURE to search the Unit list for. This is quite fast if you know even a partial SRC. If you do not enter an SRC, you will Browse the Unit list in SRC order.

'Change LIN Quantities' allows you to increase or decrease the number of items of a particular piece of equipment in a unit.

'Add Equipment LIN' allows you to add items of equipment not already on your Units equipment list. If you accidentally try to add a piece of equipment already on the Unit's list, the program will automatically screen it out.

'Delete LIN' allows you to completely remove a piece of equipment from a Unit's equipment list.

'Change Unit Strength' allows you to set the personnel strength which the program will consider as 100% of the unit's assigned strength.

'Change Unit Echelon' allows you to change the echelon used for water-consumption calculations. This program guessed the echelon when the Unit was first created.

C3. Create Custom Unit from Equipment LINs

Enter Unit Data View/Change LIN Quantities Add LINs Delete LIN Change Unit Echelon Return to Main Menu

'Create a Custom Unit'

The SURE database is regularly updated and contains most unit TOE's. However, if you have a unit which is so unlike any other in the database that it is not even worth copying the equipment data from a similar unit and adjusting it, use this option to create a Unit and, optionally, an SRC for it.

'Enter Unit Data' allows you to enter the Unit name, and optionally, an SRC.

'View/Change LIN Quantities' allows you to increase or decrease the number of items of a particular piece of equipment in a unit.

'Add Equipment LIN' allows you to add items of equipment not already on your Units equipment list. If you accidentally try to add a piece of equipment already on the Unit's list, the program will automatically screen it out.

'Delete LIN' allows you to completely remove a piece of equipment from a Unit's equipment list.

'Change Unit Strength' allows you to set the personnel strength which the program will consider as 100% of the unit's assigned strength.

'Change Unit Echelon' allows you to change the echelon used for water consumption calculations. This program guessed the echelon when the Unit was first created.

C4. Deleting a Unit

Select Unit - Unit Name Order
Select Unit - SRC Order
Delete Unit
Return to Main Menu

'Select Unit' You must select a Unit for Deletion first. Although you may select any Unit, you will not be able to actually delete any Unit that is on any Task Organization listing.

'Delete Unit' After you have selected a Unit for deletion, you can delete it. You will be asked to confirm the deletion. Once deleted, Units cannot be recovered, but must be recreated if required again.

D1. Creating a Task Organization from Units

Name Task Organization
Assign Units - Unit Name Order
Assign Units - SRC Order
Assign Unit Quantities
Create from Selected Units
Return to Main Menu

Task Organizations are groups of Units that will share common Parameter Sets during the Phases of an Order. They could be companies formed into a battalion, or battalions and an HHC formed into a brigade.

'Name Task Organization' Each Task Organization requires a unique name. This name is not changeable, nor may two Task Organizations share the same name. You may however change the Task Organization Description.

'Assign Units - Unit Name Order' After giving the new Task Organization a name, you may select any of the Units in your Unit listing. This option lists them in alphabetical order. After selecting Units, you should assign them quantities of one or more from the 'Assign Unit Quantities' menu.

'Assign Units - SRC Order' If you know the SRC's of the Units you want to add, SURE can find them quickly if you even enter a partial SRC number. After selecting Units, you should assign them quantities of one or more from the 'Assign Unit Quantities' menu.

'Assign Unit Quantities' Units that have a particular identity, such as '1-57 Infantry Bn' should normally be assigned a quantity of one. Generic Units, i.e. 'Infantry Bn', may be assigned in any quantity up to 99 each in any one Task Organization.

'Create from Selected Units' When you are done selecting Units and assigning quantities for this Task Organization, you must Create the Task Organization to save the selected data.

D2. Creating a Task Organization by Copying a Previous One

Select Task Organization to Copy
Assign New Task Organization Name
Save and Copy Another
Return to Main Menu

Task Organizations are groups of Units that will share common Parameter Sets during the Phases of an Order. They could be companies formed into a battalion, or battalions and an HHC formed into a brigade.

'Select Task Organization to Copy' If you need a new Task Organization that is similar to one previously created, it is easier to copy the old one and modify it than to create it from scratch. However, each Task Organization requires a unique name. This name is not changeable, nor may two Task Organizations share the same name. You may add or delete units, or change unit quantities to the newly copied Organization from the 'Edit Task Organization' choice on the Main Menu.

'Assign New Task Organization Name' After selecting a previous Task Organization to copy, you must give the new Task Organization a different and unique name.

'Save and Copy Another' You should save your new Task Organization after assigning it a new, unique name. You may continue to copy additional Task Organizations as necessary.

D3. Editing Task Organizations

Select Task Organization
Assign Units - Unit Name Order
Assign Units - SRC Order
View Task Organization Units/Change Unit
Quantities - Unit Name Order
View Task Organization Units/Change Unit
Quantities - SRC Order
Un-assign Units - Unit Name Order
Un-assign Units - SRC Order
Return to Main Menu

'Select Task Organization' You must have a Task Organization selected for editing before doing any other process.

'Assign Units - Unit Name Order' Any number of Units may be assigned to a Task Organization, in any quantity up to 99 each. Only Units not previously part of the selected Task Organization will be added to it. This option lists Units in alphabetical order.

'Assign Units - SRC Order' Any number of Units may be assigned to a Task Organization, in any quantity up to 99 each. Only units not previously part of the selected Task Organization will be added to it. This option lists Units in SRC Order, and optionally lets you enter an SRC for SURE to find.

'View Task Organization Units/Change Unit Quantities - Unit Name Order' You may view, and optionally edit the quantities of Units assigned to the current Task Organization. This option lists Units in alphabetical order.

'View Task Organization Units/Change Unit Quantities - SRC Order' You may view, and optionally edit the quantities of Units assigned to the current Task Organization. This option lists Units in SRC Order.

'Un-assign Units - Unit Name Order' Units un-assigned from Task Organizations are still part of your Unit listing, and may be added back to the Task Organization later if required. This option lists Units in alphabetical order.

'Un-assign Units - SRC Order' Units un-assigned from Task Organizations are still part of your Unit listing, and may be added back to the Task Organization later if required. This option lists Units in SRC order.

D4. Deleting a Task Organization

Select Task Organization Delete Task Organization Return to Main Menu

'Select Task Organization' You must select a Task Organization before-separately attempting to delete it. Task Organizations which have been assigned to an Order cannot be deleted until removed from assignment to all Orders.

'Delete Task Organization' After selecting a Task Organization, you may attempt to delete it. If it is assigned to one or more Orders, you will not be able to delete it. Deleted Task Organizations cannot be un-deleted, and must be recreated if required again.

E1. Creating a Mission Parameter Set

Create New Mission Parameter Set View Mission Parameter Sets Return to Main Menu
--

'Create Parameter Set' Parameter Sets are groups of settings that instruct the program on what factors to use when doing logistics estimations for Units in a Task Organization during a particular Phase of an Order. You must assign unique names to them, although descriptions may be changed at any time.

When you create a Parameter Set, you will be automatically directed to pick lists for the following items:

Area Profile

You may select from standard Area Profiles supplied with this program, or create non-standard ones from the 'Create Custom Area Profile' choice on the Main Menu.

Ammunition Consumption Posture

Ammunition Consumption Postures are listings of mission conditions, such as '1st Day Defense' that, in conjunction with Combat Intensity are used to estimate the quantities of ammunition consumed.

Combat Intensity

Combat Intensity, such as 'Heavy', is used in conjunction with Consumption Posture by modifying that posture through multiplication with the Combat Intensity Factor.

Combat Intensity Factor

A standard Intensity Factor is provided with each Combat Intensity. These may be modified for a particular Parameter Set, but should be done so with caution as the results will be non-doctrinal.

Class I Ration Cycle

You will select three rations, which will be used by the Parameter Set as the daily ration cycle.

Water Consumption Parameter

These should usually be set according to the echelon of the Task Organization, but may be changed. Larger quantities are calculated for higher echelons.

Class VIII (Medical) Usage Parameter

Echelon and combat intensity are used together to establish a medical usage factor that adjusts Class VIII estimates.

'View Orders' This option allows you to review Orders in the system without making changes.

'Assign Task Organizations' This option allows you to assign Task Organizations to the Order. Only Task Organizations not already assigned will be shown.

'Assign Parameter Sets to Task Organization Phases' Each Task Organization assigned to an Order must have a Parameter Set associated with it for each Phase in the Order. For example, if your Order has three Phases, each Task Organization will have a Parameter Set assigned for each Phase. You may use the

same Parameter Set for more than one Phase, and for more than one Task Organization.

E2. Editing a Mission Parameter Set

Select Parameter Set
Change Area Profile
Change Ammo Consumption Posture
Change Intensity
Change Intensity Factor
Change Class I Parameters
Change Water Consumption Parameters
Change Class VIII Medical Parameters
Return to Main Menu

'Select Parameter Set' You must choose a Parameter Set before making any changes. Changes you make will be reflected in all Orders-based consumption-reports which use that Parameter Set.

'Change Area Profile' You may select from standard Area Profiles supplied with this program, or create non-standard ones from the 'Create Custom Area Profile' choice on the Main Menu.

'Change Ammunition Consumption Posture' Ammunition Consumption Postures are listings of mission conditions, such as '1st Day Defense' that, in conjunction with Combat Intensity are used to estimate the quantities of each ammo DODIC required.

'Change Intensity' Combat Intensity, such as 'Heavy', is used in conjunction with Consumption Posture by modifying that posture through multiplication with the Combat Intensity Factor.

'Change Intensity Factor' A standard Intensity Factor is provided with each Combat Intensity. These are may be modified for a particular Parameter Set, but should be done so with caution as the results will be non-doctrinal.

'Change Class I Parameters' In the Class I Ration Cycle you will select three rations, which will be used by the Parameter Set as the daily ration cycle.

'Change Water Consumption Parameters' These should usually be set according to the echelon of the Task Organization, but may be changed. Larger quantities are calculated for higher echelons.

'Change Class VIII (Medical) Parameter' Echelon and combat intensity are used together to establish a medical usage factor that adjusts Class VIII estimates.

E3. Deleting a Mission Parameter Set

Select Parameter Set
Delete Parameter Set
Return to Main Menu

'Select Parameter Set' You must select a Parameter Set before attempting to delete it.

'Delete Parameter Set' After you have selected a Parameter Set, you may attempt to delete it. Parameter Sets which are in use by a Task Organization in an Order cannot be deleted.

E4. Create Custom Area Profile

Create Custom Area Profile
View Area Profiles
Edit Custom Area Profile
Return to Main Menu
Delete Custom Area Profile

'Create Custom Area Profile' Area Profiles establish the distance or time that fuel burning equipment can be expected to be operated for each day. While the standard Profiles supplied with this program are useful in doctrinal calculation, they do not account for exceptional situations, such as a road march or aircraft

flight of known length and time. You may create Custom Area Profiles based on standard Profiles, but you must assign them unique names.

'View Area Profiles' You may view all Profiles, standard and Custom.

'Edit Custom Area Profile' You may only edit Custom Profiles that you have created. If you edit a Profile, future logistics estimates of Orders that use that Profile will automatically reflect the changes.

'Delete Custom Area Profile' You may only delete Custom Profiles that are not in use by any Task Organization in any Order.

F1. Creating an Order

Create Order
View Orders
Assign Task Organizations
Assign Parameter Sets to Task Organization Phases
Return to Main Menu

'Create Order' Orders combine Task Organizations with Mission Profile Sets. An Order consists of a unique Order number an Order description, and a selection of Task Organizations. An order may have up to nine Phases, each Phase being of up to 99.99 days in length. Each Task Organization is assigned a Mission Profile Set for each Phase of the Order, and may also have its strength adjusted for each Phase.

'View Orders' Prior to creating an Order you may view previous Orders to aid you in assigning a unique Order number.

'Assign Task Organizations' Any number of Task Organizations may be assigned to an Order. Only Task Organizations not previously assigned to the Order will be offered as a selection.

'Assign Parameter Sets to Task Organization Phases' You may assign Parameter Sets to the Task Organizations in an order, one for each Phase, in a number of ways. Combining the following ways can significantly speed up this process.

'Assign one Parameter Set to all Task Organizations and Phases' If all or most of the Task Organizations in this order will be using the same Parameter Set for all or most Phases, use this option to assign a single Parameter Set to all.

'Assign a Parameter Set to a single Task Organization for all Phases'

Use this option if a Task Organization will be using one Parameter Set for all or most Phases.

'Assign a Parameter Set to all Task Organizations for a single Phase.' Use this option if all or most Task Organizations will be using a common Parameter Set in a specific Phase of the Order.

'Assign Parameter Sets to a Task Organization Phase by Phase' This is the most flexible option to assign Parameter Sets to each Phase for a single Task Organization.

'View this Orders Task Organizations and Parameter Sets by Phase' Use this option to view settings without changing them.

F2. Editing an Order

Get Order View/Delete Task Organizations Assign Task Organizations Assign Mission Parameter Sets to Task Organization Phase Assign Strength Percentages to Task Organization Phases Edit Order Description, Phases, and Phase Lengths Save and Edit Another Return to Main Menu
--

Assign one Parameter Set to all Task Organizations and Phases Assign a Parameter Set to one Task Organization for all Phases Assign a Parameter Set to all Task Organizations for a single Phase Assign Parameter Sets to a Task Organization Phase by Phase View this Orders Task Organizations and Parameter Sets by Phase Return to Previous Menu

Assign one Strength to all Task Organizations and Phases this Order Assign a Strength to one Task Organization for all Phases this Order Assign a Strength to all Task Organizations for a single Phase this Order Assign Strengths to a Task Organization Phase by Phase for this Order View this Orders Task Organizations and Strengths by Phase Return to Previous Menu
--

'Get Order' You must choose an order before making any changes.

'View/Delete Task Organizations' Use this option to review the names of all Task Organizations already assigned to this order, and optionally, delete them. Task Organizations deleted from an Order are still in the SURE system, and may be added back, but you will have to assign Parameter Sets again.

'Assign Task Organizations' You may add additional Task Organizations to your Order. Only Task Organizations not already assigned to the Order will be shown.

'Assign Mission Parameter Sets to Task Organization Phases' Each Task Organization must have a Parameter Set assigned for each Phase of the Order.

'Assign Strength Percentages to Task Organization Phases' Each Units equipment and assigned personnel are used as 100% strength unless you change this figure for the Task Organization for a specific phase of an Order. For example, reducing a Task Organizations strength by 90% for a particular Phase would also reduce all logistics estimates by 10% for that Phase for all Units in that Task Organization.

'Edit Order Description, Phases, and Phase Lengths' Although you may change the number of Phases in an Order, if you increase them, you will also have to assign Parameter Sets for each Task Organization for each Phase added.

'Save and Edit Another' Changes are made as you enter them, but this option resets this subsystem to assist you in making changes to another order.

F3. Deleting an Order

Get Order
Delete Order
Return to Main Menu

'Get Order' You must first select an Order before having the option to Delete it.

'Delete Order' If you delete an Order, you will not be able to un-delete it and get it back!

G1. Orders-based Reports

Select Order/Calculate Consumption
POL Estimate
Ammo Estimate
Other Supply Estimates
Return to Main Menu

Print Estimate to Printer
Print Estimate to Screen
Print Estimate to ASCII File
Change Printer Defaults
Return to Previous Menu

LIN by LIN Report, plus all Totals
Summary Report - Unit, Task Org, and Order Totals
Summary Report - Task Org and Order Totals Only
Summary Report - Order Totals Only

Orders-based Reports produce logistic's estimates from your Units, Task-Organizations, Parameter Sets, and Orders. You will be offered a choice to print them to the printer, to your computer screen, or to a an ASCII (plain text) file which can be imported, edited, and printed with any workprocessor.

'Select Order/Calculate Consumption' You must select an Order, after which basic calculations for consumption data will be automatically performed.

'POL Estimate' Bulk POL consumption estimates are automatically made by equipment LIN, by Unit, by Task Organization, and for the Order as a whole, divided by Phase. You will have the option to print the estimate to the printer, a

file, or the screen and to print out estimates LIN by LIN, or summations by Unit, Task Organization, and Order only. As this report can be quite long, printing to a file is recommended. The ASCII text file created can be imported into any word processor for viewing or printing.

'Ammo Estimate' Ammunition consumption estimates are automatically made by DODIC, equipment LIN, Unit, Task Organization, and for the order as a whole, divided by Phase. You will have the option to print the estimate to the printer, a file, or the screen and to print out estimates LIN by LIN, or as DODIC summations by Unit, Task Organization, and for the Order as a whole. As this report can be quite long, printing to a file is recommended. The ASCII text file created can be imported into any word processor for viewing or printing.

'Other Supply Estimates' Class I, Water, Class IV and Class VIII consumption estimates are made for each Unit, and summed by Task Organization and for the Order as a whole. You will have the option to print the estimate to the printer, a file, or the screen. As this report can be quite long, printing to a file is recommended. The ASCII text file created can be imported into any word processor for viewing or printing.

POL Reports

SURE Bulk POL Reports list estimated bulk consumption by Unit, Task Organization, Phase of the Order, and Order Total.

If you choose the 'LIN by LIN' option the report will list fuel consumption data and fuel tank capacity for each fuel-using LIN in each unit. Fuel tank capacity is for internal storage only - a bulk POL tanker, for example, will NOT have its bulk load included in this figure. After the LIN reports, you will get total fuel projections by Unit, Task Organization by Phase, Phase of the Order, and Order Total reports.

If you choose one of the 'Summary Report' options you will not get LIN's and their individual consumptions. You will still get Unit, Task Organization by

Phase, Phase of the Order, and Order Total reports according to the option you choose. As these reports can be quite lengthy, the 'Summary Report - Task Org and Order Totals Only' choice may be your best compromise between detailed information and length.

All estimates are adjusted for any changes to strength percentage you may have made for a particular Task Organization in a particular Phase of the Order.

Ammunition Reports

SURE Ammunition Reports list estimated ammunition consumption by Unit, Task Organization, Phase of the Order, and Order Total.

If you choose the 'LIN by LIN' option the report will list DODIC consumption data and basic loads for each DODIC-using LIN in each Unit. Weights and cubes shown are for ammunition consumed, not for basic loads. After the LIN reports by DODIC you will get DODIC wrap-ups by Unit, Task Organization by Phase, Phase of the Order, and Order Total.

If you choose one of the 'Summary Report' options you will not get LIN's and their individual consumptions. You will still get Unit, Task Organization by Phase, Phase of the Order, and Order Total reports according to the option you choose. As these reports can be quite lengthy, the 'Summary Report - Task Org and Order Totals Only' choice may be your best compromise between detailed information and length.

All estimates are adjusted for any changes to strength percentage you may have made for a particular Task Organization in a particular Phase of the Order.

'Other Supply Estimates'

In addition to POL and ammunition reports, SURE can also produce estimates for Rations, Water, Barrier/Construction material, and Medical Supplies (Class VIII). These are based on the number of personnel authorized to each Unit,

adjusted by any strength percentage change you may have made to the Unit's Task Organization for any particular Phase of the Order.

Rations are by ration type, in number of meals, water is in gallons, barrier/construction material is in pounds, and medical supplies are in pounds. Estimates are given for each Unit, for Task Organizations as a whole by Phase, for each Phase of the Order, and for the Order Total.

G2. Systems Reports

SRCs (TOE Listings)
SRC with LINs
Units
Units with LINs
Parameter Sets
Task Organizations
Task Organizations with Units
Orders
Orders with Task Organizations and Profiles
Orders with Task Orgs, Units, and Profiles
Change Printer Defaults
Return to Main Menu

'SRCs (TOE Listings)' A complete list of all SRC's supplied with the SURE system. This listing is useful in planning the Units you need to create, particularly as many SRC's are similar.

'SRC with LINs' You may select one SRC and print it with all of the TOE equipment items and quantities.

'Units' You may print a complete list of all Units you have created within the SURE system. This list is useful in planning Task Organizations.

'Units with LINs' You may print a listing of your Units with their assigned equipment LINs and quantities.

'Parameter Sets' You may print a list of all of the Parameter Sets you have created with their assigned settings.

'Task Organizations' You may print a list of all Task Organizations you have created within the SURE system.

'Task Organizations with Units' You may print a list of all Task Organizations with their assigned Units.

'Orders' You may print a list of all Orders you have created within the SURE system.

'Orders with Task Organizations and Profiles' You may print a list of all Orders with their Task Organizations and Profiles.

'Orders with Task Orgs, Units, and Profiles' You may print a list of all Orders with their Task Organizations, the Units assigned to those Task Organizations, and the Profiles assigned to each Task Organization for each Phase of the Order.

'Change Printer Defaults' You may change printer page width and page length.

Reindex Files
Backup Files
Restore Files
Printer Setup
Compressed Print ON
Compressed Print OFF

'Reindex Files' Reindexing recreates all indexes used by SURE. It is not normally needed, as SURE's compiled dBase 2.0 system should automatically prompt you if it needs to repair an index. However, if your .MDX index files should become deleted and you do not have a current backup, this will recreate the .MDX index files. Do NOT use this option without a reason!

'Backup Files' You may backup your SURE files to a floppy disk. You must have a blank, formatted floppy to start. If you use a floppy containing a previous SURE backup your old files will be overwritten.

'Restore Files' If you have a floppy disk with files from a backed-up SURE system you may Restore them to this computer. If you do so, your current files will be overwritten, and all data entered in this system will be lost and replaced from the files on the floppy disk. It is HIGHLY recommended that you do a backup of this system first before doing a Restore.

'Printer Setup' Adjust left printer margin and page length. The type of printer for compressed print, if any, is also displayed.

'Compressed Print ON' Many SURE reports must be printed in 17-pitch, compressed print. If your printer does not have a panel switch SURE will try to set the option for you. Once this option is set, SURE will remember what printer type was chosen and automatically select compressed print for reports where it is required.

'Compressed Print OFF' If you have set compressed print on from the SURE system, this option will try to restore your printer to normal print.

CHAPTER IV LIMITATIONS AND RECOMMENDATIONS

Although a radical improvement over the previous SURE 1.0 system, SURE 2.0 suffers from technical, developmental, and doctrinal limitations that should be overcome in future versions.

The dBase IV 2.0 Compiler For Dos

SURE 2.0's technical limitations are the result of using Borland's dBase IV 2.0 environment for development and fielding. While an improvement in both features and speed over previous versions of dBase, this DOS based version can neither run on 'minimal' machines --those with 640K RAM-- nor provides the advantages of a Graphical User Interface (GUI). As a result, the advantages of event-driven programming --mice, slider bars, transparent printer and display handling, etc.-- in a Windows or OS/2 environment are unavailable to the user, and Computer Aided Software Engineering (CASE) tools such as those in Computer Associates dBfast are unavailable to the programmer.

SURE 2.0 does possess the advantage of being able to run on merely obsolescent machines with 2MB of RAM, and without a mouse, making it suitable for use on older machines, particularly laptops, many of which are still in the system. However, as SURE 1.0 would run on virtually any DOS machine with a copy of an appropriate version of Lotus Developments 1-2-3™, future versions of SURE could and should be ported to a GUI environment. dBfast™ for Windows™ from Computer Associates is currently available for Microsoft Windows™, and an OS/2™ version is expected.

Procedural Limitations

Limitations of Task Organizing only one-level deep.

As noted in this paper's Introduction, SURE 2.0 has significant value in facilitating the logisticians efforts to perform parallel planning along with his maneuver counterpart as a result of its orders-based planning paradigm. Although utilization of the '2 levels down' planning concept makes SURE 2.0 valid for many operational scenarios, considerable additional utility would be gained by adding the capability to assign Task Organizations to other Task Organizations. This was one of the desires, although not a requirement of CASCOM's SURE 2.0 proposal, and is highly desirable for the next reiteration of the program.

Doctrinal Limitations

Lack of a single CSS approach to evaluation of the battlefield.

Programming the SURE system revealed clearly what was hidden in the complexity of FM 101-10-1/2: CSS planners do not have a uniform way of analyzing the battlefield, and insufficient guidance to confidently use the ways that are established. Separate parameters must be set for ammunition, fuel, water, and medical calculations only make sense if they relate to the nature of the material being issued, not the nature of the battlefield.

Users must now select from a bewildering, uncoordinated set of choices that need resolution in the near term. In particular, the CSS community needs to develop a uniform set of standards for evaluating battlefield conditions, promoting both a common set of terms and a communality of understanding of what the terms mean. What are the precise indicators for 'Heavy' combat? Are they different in different theaters, or for different types of units?

Limited use of some outputs.

Although in accordance with doctrine, SURE 2.0's outputs for Class IV and Class VIII material are of very limited use. Pounds of barrier, construction, and especially medical material may be useful for TRANSCOM or for planners at theater level, but such figures are incongruous in a program that estimates the number of rounds of 9mm ammunition and their weight to two decimal places! A knowledge of geographical area, weather, and mission conditions could and should be used to estimate quantities of sandbags, 4X4's, sheets of 3/4" marine plywood, pickets, Mod Med kits, units of blood, etc.

Conclusion

The SURE 2.x will likely continue for several years as a compiled dBase system running in the DOS environment. Its weaknesses reflect a lack of consistency within the CSS community, and should be addressed in doctrine and then in the program's capabilities. SURE 2.0 is not an extremely simple program to use, but it makes available a wealth of reports in a level of detail which would be highly impracticable to do manually, and it provides extensive Help systems to coach the new user through the process.

ENDNOTES

¹ *FM 101-10-1/2*, p. 2-0.

² As of this writing, the original SURE worksheets continue to be updated, the latest version being 1.1. As they are essentially similar, all worksheet versions are referred to as '1.x.'

³ U.S. Army, *'Supply Usage Requirements Estimator (SURE) Version 2.0 (Compiled Version)*, (Fort Lee: CASCOT, not dated), p. 1.

⁴ The SURE 2.0 convention of capitalization of major SURE elements is followed throughout this document. These include all user-created elements: Unit, Task Organization, Parameter Set, and Order.

⁵ Databases are shown with initial capitals, i.e. 'Csrclinq,' while database fields are lowercase.

⁶ More detail on SURE 2.0 program, database, and procedure relationships can be found in the appendices under the Tree Diagram.

⁷ Parameter Sets were originally referred to as Mission Profiles, and many of the procedure names reflect this earlier coding. The name was changed to Parameter Sets to avoid user confusion with Area Profiles, which are only one element in a Parameter Set.

ANNEX A

CASCOM SURE 2.0 REQUIREMENTS

Supply Usage Requirements Estimator (SURE) Version 2.0 (Compiled Version)

General Specifications

1. Background. The Supply Usage Requirements Estimator (SURE) consists of a series of Lotus 1-2-3 macro-driven programs designed to assist operational planners in estimating supply requirements for Army units. The current version of the program (Version 1.01, Sep 93) allows planners to estimate detailed equipment-based consumption for supply classes III and V, and population-based consumption for classes I, II, IV, VI, and VIII, and water. The spreadsheets included with SURE contain a number of databases upon which calculations are based. The major databases include:

- a. SRC, Designation, Strength.
- b. Equipment Density by SRC.
- c. Ammunition Rates by LIN and DODIC for a number of postures.
- d. POL Rates by LIN.
- e. Standard Equipment Usage Profiles for a number of geographic locations.
- f. Factors for population based consumption.
- g. Various factors pertaining to combat loads, combat intensities, climate, unit echelon, theater.

These databases, combined with the macros contained within the spreadsheets, provide a means by which the user can automatically calculate the desired supply estimates within a matter minutes.

2. Limitations. Although the current version of SURE puts an impressive capability within the hands of the user, it does have a significant limitation in that it requires Lotus 1-2-3 Version 2.x in order to run properly. This forces the SURE spreadsheets to be limited by the memory constraints imposed by Lotus 1-2-3. In addition, this requires each potential SURE user to own or purchase a copy of Lotus 1-2-3. The matter is complicated by the fact that there are several versions of Lotus 1-2-3 available (2.x, 3.x, Windows) as well as versions of competing software (e.g., Excel, Quattro Pro) which may or may not process Lotus macros. Many locations have standardized on another product as their preferred spreadsheet. As a result, many potential users are unable to run SURE without first incurring an additional expense.

3. Compiled SURE. With the above limitations putting a ceiling on the expansion of SURE, CASCOM (FD&E) has decided that the next major version of SURE should be totally reprogrammed as a database, as opposed to spreadsheet, application. Further, this database application will be programmed in a language that can be compiled to a stand-alone application, therefore not requiring users to possess any other application software in order to run. This new version of SURE will possess, at bare minimum, all the functionality of the Lotus-based software. In all likelihood, the functionality will be greatly enhanced to include features described below.

4. Features. The following is a list of desired hardware and software features that apply to the new SURE program. These are not to be considered hard and fast requirements, but rather "goals" which may require refinement as the programming effort takes place.

a. Hardware Environment. The compiled SURE program should be capable of being run on a minimum configuration of an IBM-compatible 80286-based PC with 640K of RAM, a 20MB Hard Drive, and MS-DOS 3.x. A color monitor cannot be assumed, as monochrome monitors and liquid crystal displays (LCD) may still be in use. (Although the initial release of the compiled SURE program will be a DOS-based program, future development may include a Windows-based version as well. This, of course, would set a different minimum for hardware requirements.)

b. Compiler. The SURE program must be compiled to a stand-alone application. The dependency upon additional run-time software is not acceptable unless the compiler licensee specifically grants the developer the rights to unlimited distribution of the run-time software. Preferred development environment is Borland's dBASE Compiler Version 2.0. This product creates an EXE file which will run in a stand-alone mode. The Borland environment has the advantage of using the standard dBASE IV Version 2.0 interpretive package as a development and testing tool.

c. Documentation. All source code will be internally documented through the liberal use of comments. Meaningful variable names will also be used to enhance the readability and understandability of the source code. All code developed will remain the property of the U.S. Army and, in particular, CASCOM. Appropriate user documentation will be developed as well.

d. File Structures. All data files will use the dBASE-compatible .DBF file structure. All rates, profiles, factors, unit data, etc., will be contained in data files, as opposed to being embedded within the source code. This structure is required so that updates to the data can be easily made without recompiling the

program. Thus, users may receive updated data disks without having to update the program.

e. User Interface. The user interface should be constructed so that the program is virtually self-explanatory. Context-sensitive help screens and functions are greatly desired. The program should employ, if at all possible, the techniques of scrolling pick lists (e.g., for selecting an SRC to use), radio buttons (e.g., for selecting only one of many echelons, intensities, profiles, postures, climates, etc.), and check boxes (e.g., in instances where more than one of many choices can be made). Programming for optional mouse usage is also desirable.

f. Colors. Liberal use of colors is desirable, but the colors chosen should be of sufficient contrast so that the program can be used on monochrome and LCD screens.

g. Output. Users should be allowed to direct output to either the screen or the printer. Existing SURE report formats are to be considered adequate for the first cut of the compiled version.

h. Integration. The current version of SURE requires the user to make separate passes through the program for Class III, Class V and the population based factors. The compiled SURE should integrate this process so that a user need make only one pass through the program to calculate estimates of any or all of the available classes of supply. Also, the population based portion of compiled SURE should draw default population figures from the SRC/task force used for the other classes of supply.

i. SRC Selection. When a user is expected to enter an SRC, they should have the choice of either entering the SRC directly or scrolling through the list of available SRCs in order to select the one desired.

j. Task Force Building. The user should be able to incorporate an existing task force within a new task force. For example, if a user is constructing a division-sized task force, he or she should be able to draw upon any brigade-sized task forces they developed earlier. Adding this feature may require a validation mechanism to prevent a user from creating a circular relationship.

k. Save Parameters. Given that a user will have to provide a set of parameters in order to initiate a SURE run (e.g., profile, posture, intensity, feeding policy, climate, echelon, theater, etc.), the program should allow the user to name and save these parameters for future use, thus avoiding having to reenter them. Users should be able to retrieve, modify, copy and delete parameters as needed.

l. Scenario Building. A desired (but not absolutely required) feature of the first version of compiled SURE is the ability to create a "scenario" over time by varying the sets of parameters applied to a unit, set of units, and/or task force.

m. Other Classes of Supply. It is highly likely that sufficient data and methodology will be available in order to incorporate classes VII and IX into the first compiled version of SURE. The programming effort should be structured to allow for this probability.

n. Profile Building. Users should be able to build their own equipment usage profiles that can be used in lieu of the ones provided with the SURE program.

o. Menu Structure. Menus should be logically structured so that the return path from a nested menu selection is the reverse of the path taken to make the selection in the first place.

5. In-Process Reviews. Once initiated, the work in progress will be subject to semi-monthly in-process reviews, with the first review tentatively scheduled for January 15, 1994. These reviews will consist of assessing and testing the program developed to that point and making recommendations for changes and/or further development. It is CASCOM's goal to have a compiled version of SURE ready for distribution by June 30, 1994. Therefore, a final draft working copy of the program should be available no later than May 15, 1994. Should the program be developed to include other classes of supply, the necessary logic, algorithms and data bases will be made available no later than February 28, 1994.

6. Summary. The intent of this document is to lay down the framework for the compiled SURE program. There is enough detail contained herein to provide the basis for discussion regarding the SURE programming effort. More detailed specifications will be prepared as required.

ANNEX B

MEMORANDUM OF UNDERSTANDING BETWEEN CASCOM
AND
THE SCHOOL FOR ADVANCED MILITARY STUDIES

MEMORANDUM OF UNDERSTANDING
BETWEEN
CASCOM AND SAMS

FOR: Commander, U.S. Army Combined Arms Support Command (CASCOM), ATTN:
ATCL-FSP, Fort Lee, Virginia 23801-6000

Director, The School for Advanced Military Studies (SAMS), Command and General Staff
College, Fort Leavenworth, Kansas 66027

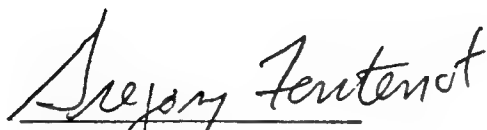

SUBJECT: Agreement between Commander, CASCOM and Director, SAMS for the production of
SURE 2.0.

1. PURPOSE: This memorandum stipulates the terms and conditions for production of *Supply Usage Requirements Estimator* (SURE) 2.0 as a database-based, stand-alone replacement for the current 1-2-3-based, macro driven version.
2. AGENCIES: The U.S. Army Combined Arms Support Command (CASCOM) is the logistics planning factors manager for the Army. Within CASCOM, the planning factors mission is assigned to the Planning Factors Management Branch, Force Development and Evaluation Directorate. The Logistics Data Base (LDB), developed by the CASCOM to store, process, and disseminate data for all classes of supply, is physically located at the Directorate of Information Management, Information Systems Command, Fort Leavenworth, Kansas. The School for Advanced Military Studies (SAMS), is an element of the Command and General Staff College, Fort Leavenworth, KS.
3. RESPONSIBILITIES: CASCOM will provide SURE 1.0, basic databases in .dbf format, a copy of dBase 2.0 for a programming environment, and will specify minimum requirements for SURE 2.0. SAMS will provide a student/programmer who will be awarded credit for one monograph for this effort, and will insure structured direction of the project through use of one or more monograph directors.
4. MILESTONES:

ITEM	PROJECTED COMPLETION	STATUS
CASCOM Visit	5-7 December 1993	Completed 5-7 Dec 93
Prospectus Turn-in	24 January 1994	
Complete CASCOM MOU	24 January 1994	
First IPR (Program Structure)	24 January 1994	
Second IPR (ALPHA Code)	23 February 1994	
Third IPR (BETA Code) [CASCOM Visit]	22 March 1994	
Monograph Final - Release Candidate Code	20 April 1994	
Monograph Final to DGDP	4 May 1994	
Program Release by CASCOM	TBD	

5. EFFECTIVE DATE. This agreement is effective from 24 January 1994 until release of program in May, 1994.

FOR THE COMMANDER:

GREGORY PONTENOT
COL, AR
Director, SAMS

 16 Feb 94

MICHAEL E. VELTEN
COL, TC
Director, Force Development
and Evaluation

ANNEX C

DEVELOPMENTAL NOTES

CASCOM Interim Comments

In addition to weekly telephone contact with Mr. Bob Miller, two sets of interim comments were made by CASCOM during SURE 2.0 development. The first, dated 17 February 1994, was received from Mr. Miller early enough in the development process to be acted upon.

The second, dated 18 March 1994, was received in a meeting with Mr. Alex Blair. It included some items not part of the original specifications or MOU. This document is divided into three areas, 'Minimum Essential Requirements,' 'Features That Are Highly Desirable for an Effective SURE V 2.0,' and 'Features That Are Desirable, but Not Necessary for an Effective SURE V 2.0.'

Most of the new 'Minimum Essential Requirements' of the 18 March document were met, with the primary exceptions of 'backing-out' from all SURE processes using the ESC key. Although this is technically possible, complete re-coding of virtually all menus would be required, an unfeasible request ninety days and 10,000 lines into the program. A compromise was reached concerning the use of SRC's vs. Units, where both capabilities would be included when selecting or editing.

Under the 'Highly Desirable' listing, use of the Enter key to move forward was included for all possible browse screens. Task Force (Task Organization) within a Task Force capability was not, for reasons covered in the main body of the monograph. Menu's were not restructured, although additional on-screen Help,

plus a context-sensitive Help system now facilitate user use of an extremely capable, though complex system.

'Desirable by Not Necessary' features were retained. 'Scenario Building,' as CASCOM terms it, is the orders-based process that is at the heart of the SURE 2.0 system. Context-sensitive Help was added and has been retained.

SURE Version 2.0 Comments - based on build of 15 Feb 94

16-17 Feb 94

John,

You've done an incredible amount of work in a very short period of time! I appreciate the frequent updates of the code, and I regret that I haven't been able to provide detailed feedback for you until now. I will try to provide you as much detail as I can as I go through the program. (I will be creating my comments in one window while I'm running the program in another.)

Before getting into some nitty gritty specifics, I'd like to suggest some generalized course corrections. Once these are in place, I think it will be easier to address some of the specifics.

The thing we need to keep in mind throughout the development of the SURE program is who the user is and what he or she expects. I think we must assume that the typical SURE user will be computer literate to the extent that they are able to run applications on the computer. For example, with the current version of SURE, the user must be literate enough to know how to load Lotus 1-2-3 and how to retrieve the AASTART spreadsheet. They are not, however, expected to be familiar with the underlying Lotus 1-2-3 program. Similarly, with Version 2 of SURE, we can expect the user to be literate enough to know how to start the SURE application. However, we cannot assume that they have any familiarity at all with the underlying dBASE program.

Therefore, it is of utmost importance that we keep the application as simple to use as possible and the keystrokes in line with what will probably be familiar based on other applications. For example, despite the idiosyncrasies of dBASE, we need to try to establish that ENTER is used to make a positive selection and ESCape is used to abort and go back one step. Similarly, if help is employed, it should be tied to the F1 key. HOME should be used to take a user to the top of a list (in lieu of dBASE's Ctrl-PgUp) and END should be used to get to the bottom. To summarize, let's use the following as "standard" keystrokes for the following activities:

ENTER	Used to select an option from a list
ESC	Used to cancel out of current operation (abort) and/or to go back one level, menu, etc.
HOME	Used to go to the top of a list
END	Used to go to a bottom of a list

Also, it is extremely important to make the program as "idiot-proof" as possible. (I realize that that is impossible because idiots are so ingenious!) This means that as you develop your code, try to see how it responds when the user hits the wrong key. As we get further along in program development, I will be trying to help you crash-proof the SURE program as much as possible.

One other thought of a general nature. When you want to take a break from programming, take time to run through the existing SURE program so that you know how it works, what the user is expected to do, and what the reports look like. Even though SURE V 2 is a total rewrite using different technology, from the user's point of view they don't want to have to completely relearn the whole program. So to the extent that the Lotus version of SURE is doing something right, we need to try and parallel that feature as much as possible in the compiled version. This is particularly true with respect to reports.

With all this in mind, let's get to the program!...

I like the way you have the main screen laid out. I also like the recent addition of the explanation for the menu options. We spoke earlier about colors, and you said you preferred to work in black & white for fear of losing contrast on a laptop's liquid crystal screen. It may seem insignificant, but I think aesthetics are very important (especially when "showing off" the program to the chain-of-command!), so let's try some color and see what happens. Here's my suggestion:

```
IF ISCOLOR()
    SET COLOR TO W+/B,B/W+
ENDIF
```

If this combination poses a problem for laptops, we can fine-tune later. I've got a laptop here at work that I can use to test things on.

Just out of curiosity, what is the purpose of the memory statistic on the next to the last line?

The way you have the menus set up is just fine. As we get further down the road, I may ask to have you rearrange the order of the major menu options to put the most frequent activities up front. I will be gathering input from people most familiar with the current SURE program and providing feedback at a later date.

Now let's deal with the "Unit" menu itself. One option we should add is the ability to Create a Unit from scratch. The user should be able to enter their own SRC, title and strength, and then select LINs from the available list.

Now I'm going to work with the "Create Unit from SRC Option". First of all (and this really applies to all submenus, not just this one), I believe we need to incorporate a "Return to Previous Menu" option in each of the submenus in order to allow the user to back up. You may wish to also tie in the ESC key to perform the same function. The first two options on this menu can actually be combined into one. When a user decides to Create a custom unit from an SRC they can be prompted to enter all or part of an SRC number. If they leave the field blank they will simply be sent to the top of the file. Your second option essentially works this way already. We probably should use the word "Custom" or some synonym thereof to distinguish a user's SRCs from those provided with the program. Your "DONE!" option works fine if the user wishes to move forward. But if they've selected a unit and then decide that they want to quit the operation, the DONE will save the selected unit whether they want to or not. My suggestion is to remove the DONE options from the menu and to incorporate a

"Do you wish to save this unit?" question into the actual unit creation routine. This question could be followed by a "Do You Wish to Create Another Custom Unit?" question. The idea here is to limit the menus to a series of options which are INDEPENDENT of each other. If one menu option is dependent upon a previous one (as we'll see in some of the other menus), then I would suggest that these not be menu options at all. To recap, for this particular menu, I would suggest the following as the available options:

- Create Custom Unit from SRC
- Create Custom Unit from Existing Custom Unit
- View Existing Custom Units
- Return to Previous Menu

Further, while sitting on the menu, I would recommend making the ESC key active and, if pressed, perform the same action as the "Return to Previous Menu" option. These suggestions can be considered applicable to most of the other menus as well.

Now I'm pressing the "Create Unit from SRC (Find SRC)" option. I like the way the look-up works. You may wish to expand the user prompt to explain that they may enter all or part of an existing SRC (or none at all to go to the top of the list). I notice that when I repeat this option, the previous field value is returned. Suggest you blank out the user input field each time. Also suggest that if a user enters an exact match there is not need to throw them into the browse screen. It should skip that step.

Now we get to the browse screens. As we discussed on the phone, and as I generalized above, it is imperative that we use the ENTER key to move forward and the ESC key to back up. I wrote some sample code which demonstrates the technique that we discussed last week.

```
DEFINE WINDOW W_BROWSE FROM 5, 10 TO 20, 70
CLEAR TYPEAHEAD
ON KEY LABEL CTRL-M KEYBOARD CHR(23)
ON KEY LABEL HOME KEYBOARD "{CTRL-PGUP}"
ON KEY LABEL END KEYBOARD "{CTRL-PGDN}"
USE C:\SURE20\SRCLIST
ACTIVATE WINDOW W_BROWSE
BROWSE NOAPPEND NOMENU NOEDIT NODELETE COMPRESS FREEZE SRC
ON KEY LABEL CTRL-M
ON KEY LABEL HOME
ON KEY LABEL END
DEACTIVATE WINDOW W_BROWSE
IF LASTKEY() = 27
    ? "YOU PRESSED ESC"
ELSE
    DISP
ENDIF
```

This sample remaps the ENTER key to Ctrl-End, the HOME key to Ctrl-PageUp and the END key to Ctrl-PageDn. It also sets up the browse window so that the cursor is "frozen" in the SRC field. You'll also note that I wrote a trap for the ESC key so that the "quit and go back" logic can be incorporated.

In a nutshell, we MUST incorporate this logic (or something similar thereto) into ALL browse screens.

On this particular browse screen, we need a prompt to instruct the user what to do.

The next screen (change the unit name and strength) has me a little confused. It appears that you are using the unit name field as a key field for identifying a unit. (I'm basing this on the paragraph of instruction that you provide with the prompt.) The key field for any unit (whether standard or custom) must be the SRC field. The user should be prompted to enter their own (unique) SRC number to distinguish it from the original. (The current SURE program allows them to change the last four positions.) The number should be checked for uniqueness (against all existing and custom SRCs) before being accepted. The Ctrl-W prompt is not really necessary on this screen. However, after the user enters their SRC number and changes the title and strength (as appropriate), they should probably be given the option to change Line Item information within the unit. (I realize that you can do it by going up two menus and then back down again, but this is a little awkward.) Once the information is entered, the user should be asked if they want to save the custom SRC. If they answer yes, then the records are saved. Whether they answer yes or no to the first questions, they should then be asked whether they want to create another custom SRC.

In your current menu, when you press DONE (either one), the "Please wait..." message appears on top of the preceding message.

OK; now I'm going back up one level and down to the "Edit Unit" option of the "Unit" Menu. When I choose the "Select Unit" option, the browse screen only has the unit titles. This should include the SRC and the strength. Also, as already discussed, selection should be made with the ENTER key. ESC should back out without selecting anything. Once you've selected a unit, you display the information at the bottom of the screen. Suggest the include the unit strength so that the user will know whether he wants to change it or not.

Actually, the header information from the SRC (title, strength, and echelon) could probably be addressed in one @ SAY... GET screen with a READ statement. (Speaking of echelon, I notice that you are providing for it as you "edit" a unit, but you haven't provided for it as you create a unit.) Of course, I'm not certain at this point what your intent is for establishing an echelon, because the original SRC list does not allow for them.

On the "Change LIN Quantities" screen, it might be better to show only one nomenclature and then have a check mark in a column indicating whether it is an ammo user or a POL user. As we fine-tune the program, we might want to come up with a master LIN file which has LIN, NOMEN, POL (T/F), and AMMO (T/F) as field names. Then, as we add other LIN-dependent classes of supply, we can add fields for Class IX (T/F), etc. If you like, I can create a file like that within a very short period of time.

Your prompt at the bottom of the screen should be changed to reflect that the user is expected to actually change quantities on the screen rather than "choose". Also, since this type of screen is different from previous browse screens (in that the user is allowed to change information), we should establish a "standard" for its use. Obviously, ENTER may be used to enter a quantity, so it could pose a problem if used to exit the browse. I would prefer not to rely on ESC to get out of browse because of what I said earlier, and I would like to reserve HOME and END to go to the top and bottom of the file. (As you can see, I'm brainstorming as I write!) Let's try this... expand the user instruction at the bottom of the screen to inform them that they can use the arrow keys to move between records, changing data along the way as they wish. When they press ENTER, have them exit the browse screen (as with the others so far), but keep the screen on the CRT and prompt them whether they are done making changes. If they answer no, then loop them back to the browse screen. I suspect new users will change a number and press ENTER (rather than an arrow), so the prompt will give them a chance to go back to the browse without having to go through another menu. (By the way, I noticed that this particular browse screen does not have append disabled, so the user can "accidentally" add new records. We need to disable this feature.)

On to "Add LIN From CASCOM List". Again, if I can provide a "master" LIN list, we can do away with the redundant nomenclature fields. When I select a LIN, I am getting a quantity from somewhere as a default. This needs to be set to zero as the user enters the routine. Once I add a LIN, I get a "different" browse screen with my new LIN added at the bottom. I don't quite understand why the user is placed in a browse screen at this point, but if you feel it is useful, then the appearance of the browse screen should be similar to that used for changing LIN quantities. Also, the list should be indexed so that it appears in LIN sequence, rather than the added LINs appearing at the bottom.

When I use the "Delete LIN" menu option, I get an error message:

```
ALIAS not found: CUNIT  
SELECT 14
```

I can get back into the routine by telling the program to "Ignore" the error, but I don't think it is working right from that point on. I can see your prompt to confirm deletion of a LIN, and this looks good. You may want to show the quantity of the LIN along with the other information. Also, you may want to handle a Yes/No situation with a prompt such as "Delete This LIN (Y/N)?" and force the user to commit one way or another. Then trap the input, check for a Y or an N, and, if neither is pressed, beep and go back to the prompt.

On to the "Delete Unit" option from the "Unit" menu. As before, when presenting the user with a list of units to choose from, be sure to include the SRC number and the strength as well.

Now I'm going to go to the next "major" menu option: "Task Org". First of all, task organizations are not limited to only those units that a user creates. They can create task organizations out of "standard" SRCs as well, or a combination of both. Secondly, when assigning units to a task organization, the user must be able to indicate a quantity associated with each unit. Recommend you change the True/False approach to a quantity field. Look how the job is done in the current SURE program. Last, we want to be able to include a task

force within a task force. Therefore, we probably should ask the user to assign a task force a number analogous to an SRC.

On to the "Profiles" menu option. First, I would recommend either using a different term than "profile" or at least modifying the term with the word "operational" in order to distinguish these profiles from equipment usage profiles. Perhaps "parameters" or "operational parameters" would be useful.

As we cycle through the parameters, let's do it in sequence by class of supply, starting with Classes I, II (you need to add this), III, IV (you need to add this one), V, VI, VIII, and water. You may want to make your original entry screen (for creating a new profile) consistent with the screen you use for editing an existing profile. As the user selects the parameters, they should not be shown all the corresponding fields. For example, when selecting rations, just show the ration types; there is no need to show the unit of measure or the weight per ration. Another example would be for Water: ask two questions, one involving organization level (CO, BTN, BDE, DIV, Above DIV) and another about climate (Temperate, Arctic, Tropic, Arid). Then use the program to look up the proper factors in the database. The user should be able to ESC out at any time, and they should be allowed to prepare an "incomplete" set of parameters (i.e., they may not care about anything but Classes III and V, so why force them to define other parameters). Then when the reports are run, and if they select a class of supply for which no parameters have been defined, they will be prompted to complete the parameters at that time.

On to the "Orders" section of the main menu... As I create an order I am asked to provide the number of phases. Then I am allowed to define the phase lengths, but I am permitted to enter phase lengths for a number of phases greater than the number I defined.

As I look through this part of the program, I sense that you're trying to make the order creation process more complex than necessary. I would propose that we define an order as applying to a SINGLE task organization. Then, as one creates an order they are prompted to identify the task organization (or single SRC if they like) to which the order applies. Then as phases are defined, they can assign the mission profiles (operational parameters) at the same time they assign the phase length. If we allow for the flexibility of having multiple task organizations within a single order, and allow for each organization to have its own set of mission profiles, then I think we are opening up a can of worms we'll never get closed again. Next thing the user would want would be variable length phases for each of his task organizations, and separate subtotals on the report for each of the task organizations. Which almost brings us back to what they would get if they defined a set of orders for each separate task organization in the first place! Perhaps, as a flexibility measure, we can allow the user to copy the contents of an existing order into a new one and then modify those parameters which they feel must change.

On to the reports!!! I tried running through the orders-based reports and selected the order that you defined. I don't think the processing is going on quite the way you intended it. It seems that the process works with ALL the task forces in the file as opposed to just those associated with the order selected.

With respect to the quick SRC-based reports (which is essentially what the current SURE program is limited to), I envision the user being able to select from a list of units including standard (CASCOM) SRCs as well as those defined by the user as a task organization. Then I would prompt the user to select which classes of supply for which they want reports. Following this would be a query asking for the input of a pre-defined set of parameters or the option to create a set "on the fly". The program would then check the parameters against the selected classes of supply for the report and prompt the user to complete any necessary parameters that have been left out. At this point, the report would be run. Since your existing report menu is essentially a sequence of dependent operations, I would suggest, based on my earlier discussion, that a menu is not the best way to solicit this type of input. Again, menus should be limited to a list of options which are sequentially independent.

I would now like to address the report format. (I haven't had a chance to check the math yet, so I'll save my comments on that until another time.) I'm afraid we must have the reports done in a TABULAR format to the maximum extent possible. Realizing that all the information will not fit on a screen (widthwise), I would suggest creating a temporary dBASE file to hold the report information and let the user "browse" the report that way. Check the current SURE reports and see what you can do to provide your information in a similar format. If we have to insist that a user have an Epson-compatible dot matrix printer (so that the reports can be compressed with a CHR\$(15)), then so be it. But it is absolutely necessary to keep the reports in rows and columns format.

The fuel consumption I'm seeing is showing up in whole numbers. We need this shown to two decimal places. Also, we need to see the total weight and total cube associated with each LIN. I noted that you provide a summary statistic for fuel tank capacity. You may want to include this on a line-by-line basis as well. (I'm not certain how useful this would be, but it may be of some importance.) We also need to show Diesel and JP4 converted into JP8 as a summary statistic. The formula is $JP8_Weight = Diesel_Weight * .095 + JP4_Weight * 1.05$. JP8 Gallons is just the straight sum of diesel and JP4. Same with JP8 Cube.

Similarly, your ammo reports need more information, such as individual DODIC weight and cube (with decimal places). Also, note that there are, in many cases, many DODICs for a given LIN. Your report appears to be showing only one DODIC per LIN. This is a one-to-many relationship. See the current SURE reports.

One feature that the current SURE program has which I don't see in your program is the ability to create/modify equipment usage profiles for use with Class III planning factors.

Also, I note that you appear to be headed in the direction of a "separate" report for population-based planning factors. I know this is the way the current SURE program does it, but this is one area where I would like the new program to differ. As I said earlier, what I envision is the user selecting which classes of supply he or she wishes to process and the program acting accordingly. You can draw the population from the SRC/task force information.

Just got your phone call... so I'll now take a look at the "system reports" that you've defined. The CASCOM SRCs report is a good idea. However, the more that I think about it, the more I think we ought to choose a different term than "CASCOM" SRCs. Perhaps "standard"

would be a better word than CASCOM. Using CASCOM implies that we develop the SRCs or have ownership of them. As these reports scroll on the screen, we must make ESC active to back out. (Currently, I think ESC will crash the program.) The SRC with LINs report is nice, but it appears to run very slowly. I note the other reports are not available yet. The printer defaults is an option under both "Reports" and "Utilities". Suggest we put it under just utilities. As we get further along, I may suggest some refinements as to exactly what a user can specify relative to the printer.

That about does it. I know this will be a lot to take in at one time, but I hope my comments will prove useful. As you're working on addressing what I have discussed, I will be getting with the functional experts within the Planning Factors Branch to discuss your previous README files.

Congratulations on the new addition to your family. I look forward to hearing from you soon.

Bob

Minimum Essential Requirements for Acceptable SURE V 2.0 Completion

1. **SURE V 1.x Functionality.** The new SURE program must at least be able to perform the same functions as the existing program. This includes, but is not limited to, the following:

A. The ability to modify and edit an SRC (to include SRC number, title, strength, and LIN composition) and save the modified unit as a "new" SRC that is treated as an equivalent to any other SRC.

B. The ability to build and modify a task force which consists of a series of one to many SRCs along with the quantity of each SRC.

C. The ability to correctly calculate POL and/or ammunition requirements based on an "on the fly" list of SRCs and quantities, or based on a previously designed task force.

D. The ability to correctly calculate population-based requirements.

2. **One Pass Operation.** The user should be able to select for which classes of supply they desire a report. The report will then be prepared according to which classes were selected. There should be no need to make separate passes for POL, ammunition and population-based classes of supply.

3. **SRC Number is Key Field.** The use of the unit name as a key field is unacceptable. The SRC number must be established as the key field. As the user builds their own units, they should be asked to assign their own SRC. Proper program checks should be made to preclude duplication of SRC numbers.

4. **Ability to Back Out Using ESC.** The user must be able to back out from virtually all operations by pressing the ESC key. Menus must be constructed to allow a user to return to the previous menu and the ESC key must be made active to perform the same function. Hitting ESC at any browse screen should return the user to the previous level without making a selection.

5. **Reports Must be Accurate, Complete and Tabular and Must be Viewable on the Screen.** The reports must contain the same elements of information as contained in the SURE V 1.x reports. The calculations must be accurate. The numeric information must be presented in a tabular fashion for readability's sake. The user must be able to view the report on the screen similar to the capability found in SURE 1.x.

6. **Debug, Debug, Debug.** While it is impossible to catch every bug in a program the size of SURE, it is imperative that every reasonable attempt be made to ensure that the program is operating according to design (logical bugs) and that it is as crashproof as possible (programming bugs). Many of the bugs pointed out in the comments of 16-17 Feb 94 still exist, plus many more have crept in. Thorough testing of each feature is essential.

Features That Are Highly Desirable for an Effective SURE V 2.0

1. **Use ENTER to Move Forward.** In lieu of Ctrl-W or other non-intuitive key sequences, use the ENTER key to indicate positive selection and the desire on the part of the user to move on to the next step.

2. **Task Force Within a Task Force.** This feature has been mentioned from the outset of program development. Perhaps the most effective way to accomplish this is to really establish two separate capabilities:

A. There would be a new capability to build a custom "unit" based on one to many SRCs (with an appropriate quantity of each). This unit would be assigned its own unique SRC number and would be treated analogous to any other SRC. This way, a user could construct a battalion from companies, a brigade from battalions, a division from brigades, etc.

B. The capability to build a "task force" consisting of one to many SRCs (with an appropriate quantity of each). This capability is already being programmed.

By combining the two capabilities, the user can effectively create a task force within a task force.

3. **Restructure Menus.** The program has gotten so complex that it is difficult for a user to know what to do first when they enter the program. In addition, many of the menu options are sequentially dependent, a feature which is not desired. Sequential steps should be handled through program operations, not menu options. When a user starts SURE, they really only want to do one of two things: run a report or perform some sort of file maintenance. A file maintenance sub-menu could then contain the categories available for modification, such as: units, task forces, supply usage parameters, equipment usage profiles, etc. Any scenario building capability would also logically fall within the file maintenance area.

***Features That Are Desirable, but Not Necessary
for an Effective SURE V 2.0***

1. **Scenario Building.** While it is recognized that a great deal of programming effort to date has been spent working on this feature, CASCOM views this to be a desirable capability only after the minimum essential capability has been established. It may be necessary to postpone this feature until a future release of SURE.

2. **Context-sensitive Help.** A context-sensitive help system will be of great benefit to any user. However, a well-constructed user interface with descriptive prompts and adequate documentation is considered adequate in the near term. Only after minimum essential and highly desirable features are implemented should time of any consequence be spent on implementing context-sensitive help.

PROCEDURE csrc_bar1
@ 9,1 CLEAR TO 16,79
@ 9,1
TEXT
  Provided SRC's include unit descriptions, unit strengths, and
  LIN information for each TOE item that consumes fuel or ammunition.
  You should select an SRC to base each unit in your organization
  on. You may modify LINs and unit strengths from the Edit Unit program,
  but unit names, once assigned, are permanent and cannot be duplicated.
  It is recommended that you do NOT use the standard SRC description as
  a unit name, but modify it to meet your needs.
ENDTEXT

FUNCTION memopagr
*-----
-
*-- Programmer...: Martin Leon (HMAN - ATBBS/Borland BBS) Modified by John
*-- Friedson
*-- Date.....: 10/28/1991
*-- Notes.....: Used to display a memo on screen, allowing user to scroll
*--              memo at will.
*-- Written for.: dBASE IV, 1.1
*-- Rev. History: 10/28/1991 -- Original 03/01/94 Modifications
*-- Calls.....: None
*-- Called by...: Any
*-- Usage.....: ?MemoPagr(<cMemo>,<ULRow>,<ULCol>,<BRRow>,<BRCol>)
*-- Example.....: ?MemoPagr(MoreData,10,20,20,65)
*-- Returns.....: .F.
*-- Parameters...: cMemo    = name of memo field
*--              nULRow    = upper left row position
*--              nULCol    = upper left column position
*--              nBRRow    = bottom right row position
*--              nBRCol    = bottom right column position

* REINDEX.PRG Reindexes dbf's
STORE PROGRAM() TO progvar
STORE "NO " TO yesnovar
ACTIVATE WINDOW process
TEXT
This will recreate all indexes used by SURE. It is not normally
needed, as SURE's compiled dBase 2.0 system should automatically
prompt you if it needs to repair an index. However, if your .MDX
index files should become deleted and you do not have a current
backup, this will recreate the .MDX index files.

ACTIVATE WINDOW huge
TEXT
  This will copy the SURE files from a previous Backup from your
  floppy drive to the hard drive. It will OVERWRITE your current files!
  If you do this you will NOT be able to get them back! Restore is useful
  when:
    1. You have done a lot of entries which have to be reversed, and
       Restoring from your last backup is faster than making changes.
    2. You are copying all of your data from one SURE system to another.
       For example, you might use one system in the office, another in
       the field.

  It is HIGHLY recommended that you do a separate backup of your current
  SURE files first!

System: SURE 2.0
System Summary

This system has:

- 16386 lines of code
 - 18 program files
 - 35 procedure files
- 321 procedures and functions
- 29 databases
- 24 multiple index files
- 34 index files
 - 0 report forms
 - 0 format files
 - 0 label forms
 - 0 binary files
- 1 memory variable file
- 0 menu files
- 0 screen files
- 1 other file
- 2 cross-referenced tokens

PROGRAM is an index tag

This index file is associated with database(s):
: HELP.DBF

Used by: REINDX.PRG

SUBJECT is an index tag

This index file is associated with database(s):
: HELP.DBF

Used by: REINDX.PRG

SRC is an index tag

This index file is associated with database(s):

- : CSRCLIST.DBF
- : SRCLIST.DBF
- : SRCLINQ.T.DBF
- : CSRCLINQ.DBF
- : TASKORG.DBF

Used by: REINDX.PRG

UNIT_DESIG is an index tag

This index file is associated with database(s):

- : CSRCLIST.DBF
- : SRCLIST.DBF

Used by: REINDX.PRG

STRENGTH is an index tag

This index file is associated with database(s):

- : CSRCLIST.DBF

Used by: REINDX.PRG

UNITNAME is an index tag

This index file is associated with database(s):

- : CSRCLIST.DBF
- : CSRCLINQ.DBF
- : TASKORG.DBF
- : CL_OTHER.DBF
- : POLEST.DBF
- : AMMOEST.DBF

Used by: REINDX.PRG

ECHELON is an index tag

This index file is associated with database(s):

- : CSRCLIST.DBF
- : ECHELONS.DBF
- : MEDICAL.DBF
- : WATER.DBF

Used by: REINDX.PRG

LIN is an index tag

This index file is associated with database(s):

- : SRCLINQ.T.DBF
- : CSRCLINQ.DBF
- : LINLIST.DBF
- : AMMORATE.DBF
- : POLRATE.DBF

: POLEST.DBF
: AMMOEST.DBF

Used by: REINDX.PRG

UNIQUELI is an index tag

This index file is associated with database(s):
: SRCLINQT.DBF

Used by: REINDX.PRG

DODIC is an index tag

This index file is associated with database(s):
: AMMORATE.DBF
: DODIC.DBF
: AMMOEST.DBF

Used by: REINDX.PRG

POL_TYPE is an index tag

This index file is associated with database(s):
: POLRATE.DBF
: POLWGT.DBF
: POLEST.DBF

Used by: REINDX.PRG

TASKORGNAM is an index tag

This index file is associated with database(s):
: TASKORG.DBF
: ORDERTAS.DBF
: CL_OTHER.DBF
: POLEST.DBF
: AMMOEST.DBF

Used by: REINDX.PRG

UNIQUEUN is an index tag

This index file is associated with database(s):
: TASKORG.DBF

Used by: REINDX.PRG

UNIQUEETA is an index tag

This index file is associated with database(s):
: TASKORG.DBF
: ORDERTAS.DBF

Used by: REINDX.PRG

NUMBER is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF
- : ORDERLST.DBF
- : POLEST.DBF
- : AMMOEST.DBF

Used by: REINDX.PRG

TASKPHAS is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF

Used by: REINDX.PRG

PROFILENAM is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF
- : CPROFILE.DBF
- : CL_OTHER.DBF

Used by: REINDX.PRG

TASKPHASE is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF

Used by: REINDX.PRG

UNIQUENU is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF

Used by: REINDX.PRG

PHASE is an index tag

This index file is associated with database(s):

- : ORDERTAS.DBF

Used by: REINDX.PRG

UNIQUETN is an index tag

This index file is associated with database(s):
: ORDERTAS.DBF

Used by: REINDX.PRG

PHASETAS is an index tag

This index file is associated with database(s):
: ORDERTAS.DBF

Used by: REINDX.PRG

MED_NAME is an index tag

This index file is associated with database(s):
: MEDICAL.DBF
: CPROFILE.DBF

Used by: REINDX.PRG

WATER_NAME is an index tag

This index file is associated with database(s):
: WATER.DBF
: CPROFILE.DBF

Used by: REINDX.PRG

RATION is an index tag

This index file is associated with database(s):
: CLASS_I.DBF

Used by: REINDX.PRG

PROFILE is an index tag

This index file is associated with database(s):
: PROFILES.DBF
: CPROFILE.DBF

Used by: REINDX.PRG

INTENSITY is an index tag

This index file is associated with database(s):
: CPROFILE.DBF

Used by: REINDX.PRG

PROFILEDES is an index tag

This index file is associated with database(s):
: CPROFILE.DBF

Used by: REINDEX.PRG

POSTURE is an index tag

This index file is associated with database(s):
: CPROFILE.DBF

Used by: REINDEX.PRG

CDE is an index tag

This index file is associated with database(s):
: CPROFILE.DBF

Used by: REINDEX.PRG

NAME is an index tag

This index file is associated with database(s):
: ORDERLST.DBF

Used by: REINDEX.PRG

DESCRIPTIO is an index tag

This index file is associated with database(s):
: ORDERLST.DBF

Used by: REINDEX.PRG

PARENT_UNI is an index tag

This index file is associated with database(s):
: POLEST.DBF

Used by: REINDEX.PRG

UNITDODI is an index tag

This index file is associated with database(s):
: AMMOEST.DBF

Used by: REINDEX.PRG
